

Package: json2aRgs (via r-universe)

September 13, 2024

Type Package

Title Parse Parameters Inside a Docker Container

Version 0.4.0

Description The functions `get_parameters()` and `get_data()` are intended to be used within a docker container with a certain file structure to read keyword arguments from the file `/in/input.json` automagically. The file `/src/tool.yaml` contains specifications on these keyword arguments, which are then passed as input to containerized R tools in the tool-runner framework.. A template for a containerized R tool, which can be used as a basis for developing new tools, is available at the following URL: <https://github.com/VForWaTer/tool_template_r>.

get_data	<i>get_data</i>
----------	-----------------

Description

This package is intended to be used inside a docker container to parse data from "/in/input.json" with the help of the input configuration in "/src/tool.yml". The data can be parsed by file extension. If return_data_paths is set to FALSE, the function will return the paths to the data files. If set to TRUE, the function will try to parse the data.

Usage

```
get_data(return_data_paths = FALSE)
```

Arguments

return_data_paths
Logical. If FALSE (default), the function will return the paths to the data files.
If TRUE, the function will try to parse the data.

Value

A list of the parsed data specified in "/in/input.json"

Examples

```
## Not run:  
  data <- get_data()  
  
## End(Not run)
```

get_parameters	<i>get_parameters</i>
----------------	-----------------------

Description

This package is intended to be used inside a docker container to parse parameters from "/in/input.json" with the help of the parameter configuration in "/src/tool.yml".

Usage

```
get_parameters()
```

Value

A list of the parsed parameters specified in "/in/input.json"

Examples

```
## Not run:  
params <- get_parameters()  
  
## End(Not run)
```
